<center>Obstacles/Approaches</center>

Some problems we had as a group during the early stages was how we wanted to start the project since there were a lot of options and we did not want to rush and choose something that would later hurt progress on the project. During our first sprint our approach was mostly brainstorming ideas for the vision of the project and assigning roles and forming a schedule. The main obstacle we faced was mainly the language we chose to write in and this definitely came back during sprint 4 to slow down progress and complicate things. However during sprint 2 we had completed creating a simple webpage on WordPress and even had a simple diagram to show the different options we want to display to the user. The main problem in this sprint was the diagram which was designed in the format of a phone. This was not terrible since it was mainly an idea to show how the home page would accept users, display movies and voting which the phone mockup diagram had. During sprint 3 there was a lot more front end and back end work on the website. The problems in this sprint were minimal and a lot got done for example the data table that displays the movies and the voting option for movies. In the final sprint there was a problem with setting up a remote server and there were problems with connecting spring boot to our server with jpa and jdbc and both failed and had to switch to php last minute. The devs tried a lot of things with spring boot but in the end it didn't work. These are some of the obstacles and approaches we faced to create this final product.
